

# Calcium Grit Fine Supplement

---

## Use

This product is a supplementary food for small psittacines (of genera *Nymphicus*, *Agapornis*, *Melopsittacus*, *Aratinga*, *Pionites*, etc.).

It is used to correct calcium deficiencies typical of seed mixtures and to cover the calcium demand during the laying stage. Birds measure themselves the intake of calcium-rich foods according to their needs.

---

## Directions for use

It must be supplied in a separate feeder freely available. The availability of calcium grit allows the voluntary intake of calcium required for psittacines in every moment.

As an inert food, if the type of feeder prevents it to get wet or dirty, it may remain there for weeks without being damaged.

---

## Daily intake

The voluntary consume of calcium grit depends on the calcium deficiency of the ingest diet in every moment. The diets based on seed mixtures require a regular intake of calcium grit. Contrary, if the diet is based on the complete feed (PSITTACUS Micro or Mini formulas), its use must be sporadic. In both cases, its consumption increases significantly at the time of egg laying. As a guide, average consumption varies between 0 and a maximum of 2% of the diet.

---

## Composition

Oyster shell, calcium carbonate

---

## Analytical constituents

Moisture 2,0%, Crude protein 0,0%, Crude oils and fats 0,0%, Crude fibres 0,0%, Crude ash 95,5%, Calcium 45,6%

---

## Package size

2 kg bags
